

Heritage Skylights

Our self supporting Heritage hipped skylights are ideal as a replacement product for existing skylights on listed or historic buildings where a sympathetic replacement is a requirement.

Our Heritage lead covered steel glazing bars are combined to great effect with matching polyester powder coated structural aluminium ridge, hip and cill members. Neatly dressed Code 4 lead flashings are also supplied externally to create the weathering at the ridge and hip positions.

These skylights can also be provided with glazed vertical upstand frames and are available in bespoke designs to suit existing curb patterns.

The curb must be supplied at least 75mm wide to accommodate our cill member.

We manufacture to any size with a general maximum curb width of 4000mm and the skylights can be supplied in any length required.

The skylight can be supplied in both double glazed and single glazed formats and also at any pitch starting at 15° up to a maximum of 60°.

All our Skylights are fully assembled in our factory during manufacture to ensure a perfect fit with no site cutting required.

On larger skylights we install stainless steel tension wires at the curb positions at approximately three metre intervals along the ridge line to prevent the horizontal loadings being transferred to the builders curb.
